

AREBA RUFs Predicted Secondary Structures

April 22, 2014

Top50: the RUF is one of the most expressed RNAs. #AREBA, the total number of homologs among AREBA species.

RNAz predicts RNA secondary structure in multiple sequence alignments. If RNAz p-value is higher than 0.5, it is classified as structures RNA. We increased the threshold to 0.7 to decrease false positive rate.

RNAcode predicts the coding potential of an RNA multiple sequence alignment. If p-value is lower than 0.05, it is classified as coding RNA.

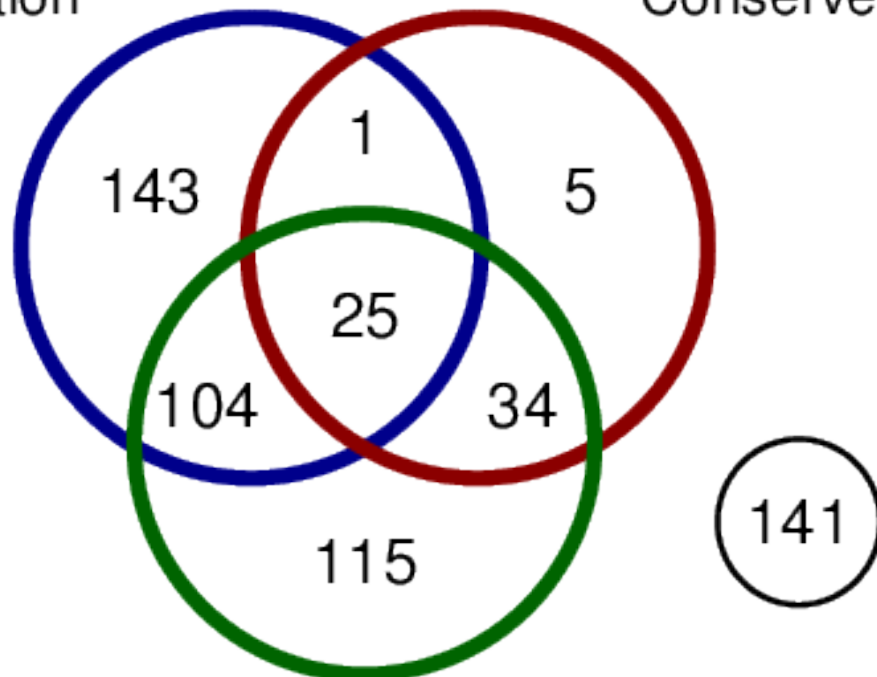

If RNALfold p-value is lower than 0.05, RNA has statistically significant secondary structure than dinucleotide shuffled random RNA sequences.

AlifoldZ predicts the z-score of native minimum free energy (MFE) of alignment by comparing MFE of shuffled multiple sequence alignments. We set the threshold of z-score to -2.5.

Highly Expressed RUFs

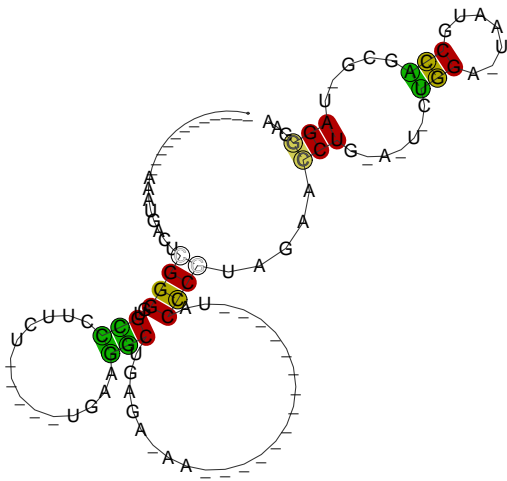

Secondary Structure
Formation

Medium or Highly
Conserved

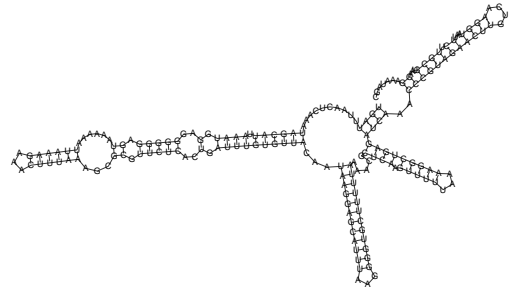

Expressed in other AREBA Species
